

Types of teeth and gum problems

Over 80% of dogs and cats over the age of 3 will suffer from some form of periodontal disease. Bacteria live naturally in your pets mouth and will multiply on the surface of the teeth forming plaque.

Plaque builds up and creates tartar which in the early stages will lead to inflammation around the gum line (gingivitis)

An example of early stage gum disease in a dog caused by plaque build up

Left unmanaged, this plaque and tartar will continue to build, eventually causing more advanced periodontal disease. At this stage, your vet may need to perform a scale and polish to remove the plaque.

In advanced cases, surgery may be needed to extract some teeth if the problem has caused more serious tooth decay.

What is Stomodine F?

Stomodine F is a specially formulated gel for the teeth and gums which helps maintain good oral hygiene in your dog or cat.

As it is a gel, application is easier than conventional tooth brushing making effective long term oral care at home easier.

Stomodine F contains:

- Chlorhexidine
- Tris EDTA
- Phytosphingosine
- Safflower Oil
- Artificial beef flavouring to aid compliance

Its combination of active ingredients help to:

- Reduce bacteria that cause bad breath
- Fight the bacteria that help cause tooth decay and gum problems
- Slow the formation of plaque which contributes to tooth decay
- Soothe and reduce inflammation of the gums

Why might my pet need Stomodine F?

Just as we have to look after our own teeth, it is very important to care for your dog or cat's teeth too.

Like ours, plaque and tartar can build up over time on your pet's teeth. Without proper care, your pet's teeth will begin to show signs of decay which can lead to a variety of teeth and gum problems.

Signs of teeth and gum problems include:

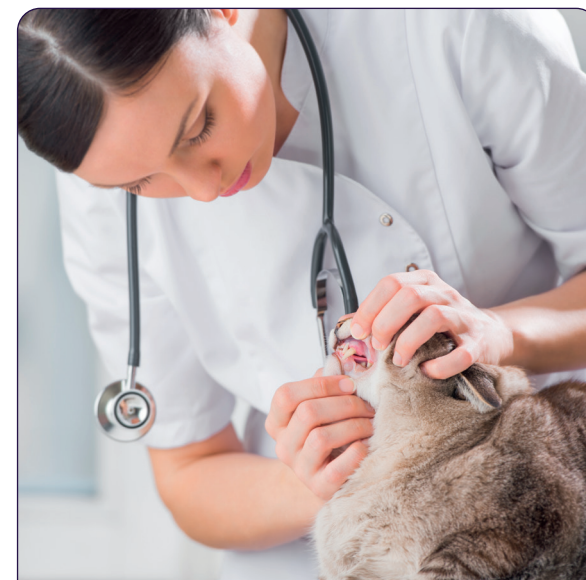

- Bad breath
- Red or swollen gums
- Discoloured teeth
- Trouble eating

Some of these problems may be relatively minor and can be managed at home with proper care. However, the more progressed the problem, the more likely your pet will need to undergo some form of dental surgery.

If your pet's teeth do require surgical intervention, such as a scale and polish or extractions, then it is important to keep the teeth and gums healthy afterwards to prevent the need for further surgery again in the future.

Healthy dogs teeth!

Apply Stomodine F with finger or the applicator

How to give Stomodine F

Using either a finger or the applicator included, apply the product between the lips and gums and gently massage in.

Apply 1-2 times per day

Use initially for at least 2-3 weeks and then as required or as advised by your vet

Stomodine F can be used after dental surgery, including scale and polish or extractions to help soothe the gums and maintain good long-term oral hygiene.
